

PRINTING WITH CREATOR

High-paced research and adaptation in terms of productivity and new standards of graphic quality have sustained the technological evolution of Creator for years. Below are some features highly praised by customers, distinguishing Creator as a specialised medium for color printing.

Runnability

The Creator product family is manufactured under strict controls of all its physical properties. Sheet formation and dimensional stability are decisive factors in maintaining high sheet-feed speeds in offset machines.

Smoothness

The formulation of the coating and its subsequent calendering ensure the smoothness of the printing surface and precise dot transfer even in the finest areas of the image

Quick drying

Creator offers an excellent easy-to-handle surface for color printing. Thanks to the regularity of its microporosity levels, printing ink penetrates the coated surface evenly, promoting quick oxidation and polymerisation of pigments and resins.

Ink gloss

Whether the finish is gloss, matt or satin, Creator ensures a slick smooth feel while adding gloss to inks and tonal density to pigments for clear reading of texts and accurate reproduction of color images.

Neutral conditions

Manufactured to neutral conditions, Creator preserves all its qualities over time.
